

AMENDMENTS TO THE ABSTRACT

Please substitute the following paragraph for the abstract now appearing in the currently filed specification:

--When an Internet access operation is conducted, a browser demands acquisition of an HTML document from an HTTP server. When receiving the demand, the HTTP server reads out contents and transmits the read out contents to a terminal apparatus. The browser interprets the received contents, and if an exclusive tag for explaining an outline of the contents exists, the browser sends to the HTTP server an acquisition demand of a voice data for explaining the outline of the contents. Upon receiving the acquisition demand, the HTTP server reads out the specified voice data, and transmits it to the browser. At the browser side, the voice data is stored in a memory, and a regeneration demand of the downloaded voice data is issued. A voice control section regenerates the voice data and outputs it from a speaker.--
